Application: Theory

$$Ax = b \rightarrow$$

Application: Theory

$$Ax = b \to \underbrace{LU}_A x = b$$

Application: Theory

$$Ax = b \to \underbrace{LU}_{A} x = b \to L \underbrace{c}_{Ux} = b$$

Application: Theory

$$Ax = b \rightarrow \underbrace{LU}_{A} x = b \rightarrow L \underbrace{c}_{Ux} = b \rightarrow Ux = c \rightarrow Ans: x$$

There are two steps:

- 1. Factor (from A find its factors L and U)
- 2. **Solve** (from *L* and *U* and *b* find the solution *x*)

Application: Case Study

#### Description

Try to solve such systems using:

- Gauss-Jordan elimination
- LU factorization

Compare time consuption

$$AX = B$$
, where  $A = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 3 & 3 \\ -3 & 10 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix}$ 

$$B_{j+1} = B_j + X_j$$
, for  $j = 1, 2$ , where  $B_1 = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$

Which number c leads to zero in the second pivot position? A row exchange is needed and A = LU will not be possible. Which c produces zero in the third pivot position? Then a row exchange can't help and elimination fails:

$$A = \begin{bmatrix} 1 & c & 0 \\ 2 & 4 & 1 \\ 3 & 5 & 1 \end{bmatrix}.$$

Which number c leads to zero in the second pivot position? A row exchange is needed and A = LU will not be possible. Which c produces zero in the third pivot position? Then a row exchange can't help and elimination fails:

$$A = \begin{bmatrix} 1 & c & 0 \\ 2 & 4 & 1 \\ 3 & 5 & 1 \end{bmatrix}.$$

#### **Answer**

c=2 leads to zero in the second pivot position: exchange rows and not singular.

c=1 leads to zero in the third pivot position. In this case the matrix is *singular*.

Find L and U for

$$A = \begin{bmatrix} a & r & r & r \\ a & b & s & s \\ a & b & c & t \\ a & b & c & d \end{bmatrix}.$$

Find the four conditions on a, b, c, d, r, s, t to get A = LU with four pivots.

This nonsymmetric matrix will have the same L as in Problem 13:

Find 
$$L$$
 and  $U$  for

$$A = \begin{bmatrix} a & r & r & r \\ a & b & s & s \\ a & b & c & t \\ a & b & c & d \end{bmatrix}.$$

Find the four conditions on a, b, c, d, r, s, t to get A = LU with four pivots.

#### Answer

$$\begin{bmatrix} r & r & r \\ b-r & s-r & s-r \\ c-s & t-s \\ d-t \end{bmatrix}. \text{ Need } \begin{cases} a \neq 0 \\ b \neq r \\ c \neq s \\ d \neq t \end{cases}$$

If A and B have nonzeros in the positions marked by x, which zeros (marked by 0) stay zero in their factors L and U?

$$A = \begin{bmatrix} x & x & x & x \\ x & x & x & 0 \\ 0 & x & x & x \\ 0 & 0 & x & x \end{bmatrix} \qquad B = \begin{bmatrix} x & x & x & 0 \\ x & x & 0 & x \\ x & 0 & x & x \\ 0 & x & x & x \end{bmatrix}.$$

$$B = \begin{bmatrix} x & x & x & 0 \\ x & x & 0 & x \\ x & 0 & x & x \\ 0 & x & x & x \end{bmatrix}$$

If A and B have nonzeros in the positions marked by x, which zeros (marked by 0) stay zero in their factors L and U?

$$A = \begin{bmatrix} x & x & x & x \\ x & x & x & 0 \\ 0 & x & x & x \\ 0 & 0 & x & x \end{bmatrix} \qquad B = \begin{bmatrix} x & x & x & 0 \\ x & x & 0 & x \\ x & 0 & x & x \\ 0 & x & x & x \end{bmatrix}.$$

#### **Answer**

For the first matrix A, L keeps the 3 lower zeros at the start of rows. But U may not have the upper zero where  $A_{24} = 0$ . For the second matrix B, L keeps the bottom left zero at the start of row 4. U keeps the upper right zero at the start of column 4. One zero in A and two zeros in B are filled in.
